# Recap & outline

So far, we:

Covered a wide range of material including: the CKM matrix; Kaon and  $B$ -meson mixing; 3 types of  $CP$  violation; how to measure the 3 angles of the unitarity triangle; and quarkonium studies.

We've focused heavily on experimental challenges and techniques, including: tracking; Dalitz; decays with undetectable particles (neutrinos); multi-dimensional fits; background-subtracted fits; and more.

Today, we'll:

Focus on rare decays and new physics searches at  $B$  meson factories. We'll see how these are complementary to searches at the LHC.

Time permitting, we'll close with a general review of mixing, where we'll briefly discuss the  $B_s$  and  $D$  meson systems. We'll also look into the  $D$  decays where mixing was first discovered.

# What are rare $B$ decays?

*Loose definition:*

Every  $B$  decay that doesn't proceed by the dominant  $b \rightarrow c$  transition.

External spectator  $b \rightarrow u$

Penguin  $b \rightarrow s(d)$

Internal spectator  $b \rightarrow u$

$W$  exchange  $b \rightarrow u$

$W$  annihilation

Hairpin diagram

# Why rare decays?

Lessons from history:

Experimental observations:

↪ observed  $K^+ \rightarrow \mu^+ \nu_\mu$  but not  $K^0 \rightarrow \mu^+ \mu^-$

GIM (Glashow, Iliopoulos, Maiani) mechanism (1970)

↪ no tree level Flavor Changing Neutral Currents

↪ suppression of FCNC via loops

↪ Requires that quarks come in pairs (doublets)

↪ **Predicts existence of charm quark**

Discovery of  $J/\psi(c\bar{c})$  state (1974)

# Quest for New Physics

## Energy frontier

↪ Direct observation of particles and processes  
using highest achievable energies

## Intensity frontier

↪ Indirect observation of NP effects on (rare) known processes

Energy frontier

vs.

Intensity frontier

Illustrative reach of NP searches with  $\mathcal{O}(10^2)$  higher luminosity

BelleII TDR [arXiv:1011.0352]

High energy frontier (LHC) – direct searches of NP up to  $\mathcal{O}(1 \text{ TeV})$

Intensity frontier (SuperKEKB)

$\Rightarrow$  Up to  $\mathcal{O}(1 \text{ TeV})$  if Minimal Flavor Violation assumed.

$\Rightarrow$  Up to  $\mathcal{O}(100 \text{ TeV})$  if Flavor Violation coupling enhanced.

# New physics searches in rare $B$ decays

## Search for effect of unknown particles on processes very rare within the SM

- We covered  $\tau\nu$  and  $D^*\tau\nu$  in our lecture on *decays with neutrinos in the final state*.
- Today we'll look at additional channels (including some radiative [ $\gamma$ ] decays) for NP effects.

Look for any deviation from the SM predictions...

# New Physics signatures?

Possible observables:

- Decay rates

- Direct  $CP$  violation

- Time-dependent  $CP$  violation

- Asymmetries in angular distributions

- ...

# Observables and experiments

## Belle II

- Clean experimental environment.
- Holistic interpretation of events with missing energy ( $\nu$ ).
- Decays with multiple photons.
- Inclusive decays ( $B \rightarrow X_s, d \gamma$ ).
- Long-lived particles ( $K_S$  and  $K_L$ ).

## LHCb

- Large cross section.
- Decays to all charged particle final states.
- Fast mixing.

*Tensions with the SM  
in semileptonic  $B$  decays*

# Recall the different tag-side reconstructions

## Tagging techniques

### Inclusive

$B \rightarrow \text{anything}$   
 $\epsilon \approx \mathcal{O}(2\%)$

Very large statistics;  
Also very large background

### Semileptonic

$B \rightarrow D^{(*)} \ell \nu_\ell$   
 $\epsilon \approx \mathcal{O}(0.2\%)$

Mid-range reconstruction  
efficiency;  
Less information about  $B_{\text{tag}}$   
due to neutrino

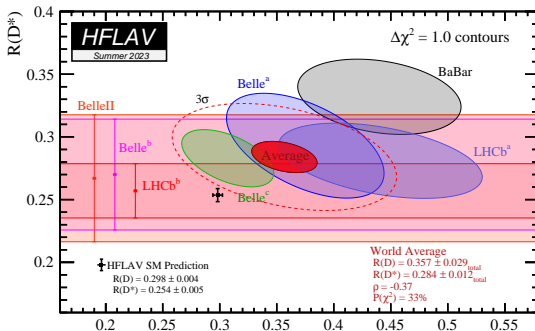

### Hadronic

$B \rightarrow \text{hadrons}$   
 $\epsilon \approx \mathcal{O}(0.1\%)$

Cleaner sample  
Knowledge of  $p(B_{\text{sig}})$ ;  
Lower tagging efficiency

$$\bar{B} \rightarrow D^{(*)} \tau \bar{\nu}$$

- Very clean prediction from theory.
- New Physics could change the ratios
 
$$\mathcal{R}(D^{(*)}) = \frac{\mathcal{B}(\bar{B} \rightarrow D^{(*)} \tau \nu)}{\mathcal{B}(\bar{B} \rightarrow D^{(*)} \ell \nu)}.$$
- Effect could be different for  $D$  and  $D^*$ .
- World average  $3.1\sigma$  away from SM.

## DNN based $e^+e^- \rightarrow q\bar{q}$ suppression

# Electroweak penguin decays $b \rightarrow s l^+ l^-$

- Within the SM, decays proceed via one loop diagram:

JHEP0712:040,2007

$$\mathcal{R}_K = \frac{\mathcal{B}(B^+ \rightarrow K^+ \mu^+ \mu^-)}{\mathcal{B}(B^+ \rightarrow K^+ e^+ e^-)} = 1.00030^{+0.00010}_{-0.00007}$$

- In 2021, LHCb reported a  $3.1\sigma$  deviation for the dilepton invariant mass squared region

$$1.1 < q^2 < 6 \text{ GeV}^4/c^2:$$

$$\mathcal{R}_K = 0.846^{+0.042+0.013}_{-0.039-0.012}$$

Nature Physics 18, (2022) 277-282

(This supercedes a tension reported in 2019 w/5fb<sup>-1</sup>)

- Electrons and muons have the same  $\varepsilon$  at Belle II:  
 $\Rightarrow$  Both *low* and *high*  $q^2$  regions possible.

Test of lepton universality in beauty-quark decays

LHCb collaboration\*

The standard model of particle physics currently provides our best description of fundamental particles and their interactions. The theory predicts that the different charged leptons, the electron, muon and tau, have identical electroweak interaction strengths. Previous measurements have shown that a wide range of particle decays are consistent with this principle of lepton universality. This article presents evidence for the breaking of lepton universality in beauty-quark decays, with a significance of 3.1 standard deviations, based on proton-proton collision data collected with the LHCb detector at CERN's Large Hadron Collider. The measurements are of processes in which a beauty meson transforms into a strange meson with the emission of either an electron and a positron, or a muon and an antimuon. If confirmed by future measurements, the violation of lepton universality would imply physics beyond the standard model, such as a new fundamental interaction between quarks and leptons.

# $R(K^{(*)})$ anomaly vanishes in 12/2022

<https://indico.cern.ch/event/1187945/>

# Still some hope: *Full angular analysis of $B \rightarrow K^* l l$*

## 2017 ATLAS & CMS results, and lepton-flavor-dependent angular analysis by Belle

Plot: S. Wehle

Belle: PRL 118, 111801 (2017)

- Largest deviation of **2.6 $\sigma$**  from the SM for the **muon channel** for  $4 < q^2 < 8 \text{ GeV}^4/c^2$ .
- **Electron channel** deviation of **1.1 $\sigma$** .
- Belle II and LHCb will be comparable for this process.
- Belle II will be able to perform an isospin comparison of  $K^{*+}$  and  $K^{*0}$ , or the ground states  $K$ .

Belle II sensitivity of  $P'_3$

$q^2 \text{ (GeV}^2\text{)}$	Belle	Belle II (50ab $^{-1}$ )
0.10 - 4.00	0.416	0.059
4.00 - 8.00	0.277	0.040
10.09 - 12.00	0.344	0.049
14.18 - 19.00	0.248	0.033

*Neutrino electroweak penguin decays*  
*⇒ The ultimate test of Belle II*

# Neutrino EWP decays $b \rightarrow s\nu\bar{\nu}$ : SM and NP

Electroweak-penguin (EWP) decays with 2  $\nu$ 's in the final state.

**Theoretically clean** due to a maximum of one electromagnetically interacting charged particle in the final state, **as opposed to  $K^{(*)}l^+l^-$  decays**.

Recall, FCNC are forbidden in the SM at tree level, but allowed at loop level.

$\Rightarrow$  *Very sensitive to NP entering the loops. Several new physics models (SUSY, non-standard Z coupling) could enhance these decays. Can probe higher mass scales than direct searches.*

# Signal extraction

Extract the signal yield by fitting the Extra Energy in the Calorimeter:

*Sum of energies of neutral clusters not associated with reconstructed particles*

$$E_{ECL} = \sum E_{\text{Calor.}} - (\sum E_{\text{tag}} + \sum E_{\text{sig}})$$

Extensive Toy MC studies performed to estimate sensitivity: 1K bkgd.-only samples generated and fit for yield estimate. Fit bias estimated from ensemble tests and corrected for in fit to data.  
(plot for  $K^+\nu\bar{\nu}$ )

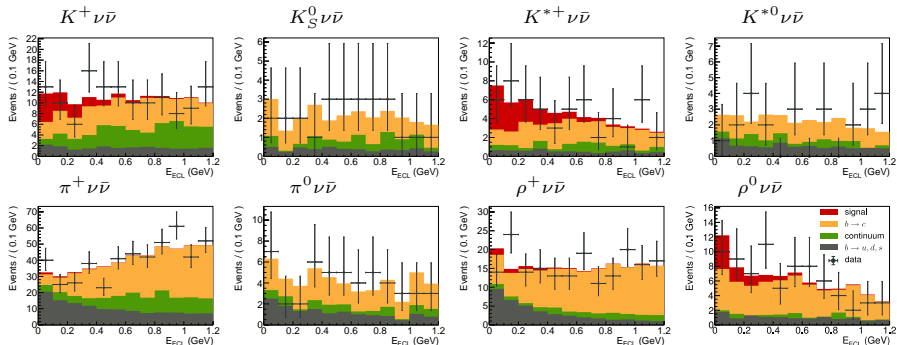

Charm  $B$  decay &  $q\bar{q}$  background for  $K^+\nu\bar{\nu}$  in  $E_{ECL} \in (0, 1.2)$  GeV.

*Dominant  $b \rightarrow c$  contribution from semileptonic  $B$  decays.*

	contribution in %
continuum	22.6
2 leptons missing	15.3
$K_L$ s and lepton missing	6.5
lepton and hadrons missing	24.1
2 charged hadrons missing	1.7
wrong $B$ type	3.8
hadronic, $K_L$ missing	24.1
hadronic $\pi^0$ missing	1.0
no match	0.0
other	1.0

# Fit to data

## Extended binned ML fit to $E_{ECL}$ :

- Histogram templates to model signal and bkgds from **charm  $B$  decay**, **charmless  $B$  decay**, and **continuum**.
- Relative fractions of the background components fixed to MC expectations.
- Signal and overall background yield allowed to vary.

Channel	Observed $N_{\text{sig}}$	Significance
$K^+\nu\bar{\nu}$	$17.7 \pm 9.1 \pm 3.4$	$1.9\sigma$
$K_S^0\nu\bar{\nu}$	$0.6 \pm 4.2 \pm 1.4$	$0.0\sigma$
$K^{*+}\nu\bar{\nu}$	$16.2 \pm 7.4 \pm 1.8$	$2.3\sigma$
$K^{*0}\nu\bar{\nu}$	$-2.0 \pm 3.6 \pm 1.8$	$0.0\sigma$
$\pi^+\nu\bar{\nu}$	$5.6 \pm 15.1 \pm 5.9$	$0.0\sigma$
$\pi^0\nu\bar{\nu}$	$0.2 \pm 5.6 \pm 1.6$	$0.0\sigma$
$\rho^+\nu\bar{\nu}$	$6.2 \pm 12.3 \pm 2.4$	$0.3\sigma$
$\rho^0\nu\bar{\nu}$	$11.9 \pm 9.0 \pm 3.6$	$1.2\sigma$

- **Expected (exp.) and observed upper limits at the 90% confidence level** (including systematic uncertainties)

Channel	Efficiency	Expected Limit	Measured Limit
$K^+ \nu \bar{\nu}$	$2.16 \times 10^{-3}$	$0.8 \times 10^{-5}$	$1.9 \times 10^{-5}$
$K_S^0 \nu \bar{\nu}$	$0.91 \times 10^{-3}$	$1.2 \times 10^{-5}$	$1.3 \times 10^{-5}$
$K^{*+} \nu \bar{\nu}$	$0.57 \times 10^{-3}$	$2.4 \times 10^{-5}$	$6.1 \times 10^{-5}$
$K^{*0} \nu \bar{\nu}$	$0.51 \times 10^{-3}$	$2.4 \times 10^{-5}$	$1.8 \times 10^{-5}$
$\pi^+ \nu \bar{\nu}$	$2.92 \times 10^{-3}$	$1.3 \times 10^{-5}$	$1.4 \times 10^{-5}$
$\pi^0 \nu \bar{\nu}$	$1.42 \times 10^{-3}$	$1.0 \times 10^{-5}$	$0.9 \times 10^{-5}$
$\rho^+ \nu \bar{\nu}$	$1.11 \times 10^{-3}$	$2.5 \times 10^{-5}$	$3.0 \times 10^{-5}$
$\rho^0 \nu \bar{\nu}$	$0.82 \times 10^{-3}$	$2.2 \times 10^{-5}$	$4.0 \times 10^{-5}$

## Combine charged and neutral modes:

- The systematic uncertainties are evaluated on independent MC and data control samples for charged and neutral modes.  
 $\Rightarrow$  *Can be considered uncorrelated.*
- Add the  $-\mathcal{L}$  and scale the  $\mathcal{B}$  of the neutral modes by  $\tau_B^+/\tau_B^0$  and repeat the calculation of the limit:

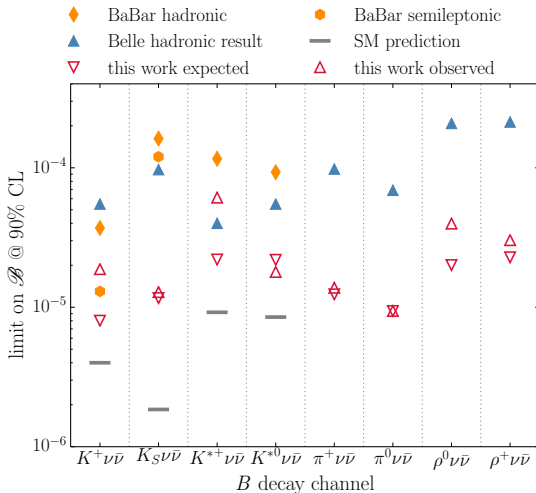

$$\mathcal{B}(B \rightarrow K \nu \bar{\nu}) < 1.6 \times 10^{-5}$$

$$\mathcal{B}(B \rightarrow K^* \nu \bar{\nu}) < 2.7 \times 10^{-5}$$

$$\mathcal{B}(B \rightarrow \pi \nu \bar{\nu}) < 0.8 \times 10^{-5}$$

$$\mathcal{B}(B \rightarrow \rho \nu \bar{\nu}) < 2.8 \times 10^{-5}$$

# Comparison with other measurements

**Worlds most stringent limits obtained for:**

$$B^0 \rightarrow K_S^0 \nu \bar{\nu}, \quad B^0 \rightarrow K^{*0} \nu \bar{\nu}, \quad B^{+/-} \rightarrow \pi^{+/-} \nu \bar{\nu}, \quad B^{+/-} \rightarrow \rho^{+/-} \nu \bar{\nu}$$

# *Dark sector*

# Dark sector

- Dark matter suggests the presence of a dark sector, neutral under all Standard Model forces (i.e. non-WIMP)

# Dark sector

- recently strong interest in dark sector models
- introduce a vector boson  $A$ , and often a dark Higgs  $h'$  by a Higgs mechanism
- can explain the inconsistencies observed in astrophysical data and dark matter experiments
  - ▶ positron excess but no  $\bar{p}$  excess (PAMELA - figure left)
  - ▶ direct detection of dark matter (DAMA/LIBRA - figure right)

PAMELA, Nature 458, 607-609 (2009)

# ALP searches in rare $B$ decays

- When axion-like particles couple to SU(2) gauge bosons, they can be produced in rare  $B$  decays

Slides 30-33 from Brian Shuve's [talk](#) at the [Long-lived particles at Belle II workshop](#).

# LLP signal shape

# Analysis strategy

- Reconstruct  $B^\pm \rightarrow K^\pm a$ ,  $a \rightarrow \gamma\gamma$  candidates, look for narrow peak in diphoton invariant mass spectrum
- Train a BDT using signal & background MC events, include shape variables, kinematic information, track/cluster multiplicities, PID,...

# Limits on ALP coupling

- The coupling  $g_{aW}$  predicts both ALP BF and lifetime
- Use limit on BF as function of lifetime to set limit on  $g_{aW}$

- Improve limit on coupling by over 2 orders of magnitude for many masses!

*Belle II analysis starting at KIT now (WS19/20 TP2 student)*

# Additional channels: challenging combinatorics

Search for the dark Photon and dark Higgs boson in 6-body FS at Belle.

$e^+e^- \rightarrow Ah' \rightarrow AAA$  with  $A \rightarrow l^+l^-$  ( $l = e, \mu$ ) or hadrons

Phys. Rev. Lett. **114**, 211801 (2015)

## *New physics in right handed currents*

# Right-handed currents

Despite the tremendous success of the SM, there are still open questions that are unanswered and motivate further model-building. E.g.,

- 1) Quark and Lepton flavour & mass hierarchy,
- 2) Matter dominance.

A common model-building steps towards solving such grand questions is to extend the gauge structure of the SM.

One of the simplest extensions involves an additional **right handed SU(2)**.

$\Rightarrow$  *New heavy gauge bosons  $W$ ,  $Z$  and new heavy charged and neutral Higgs particles.*

$\Rightarrow$  *Quark flavour mixing matrices  $V_L = V_{CKM}$  and  $V_R$  describing left- and right-handed charged current interactions; introduces 5 additional CP phases.*

# Recall the mass hierarchy of the elementary particles

and the SM gauge:

## Quarks

$$\begin{pmatrix} u \\ d' \end{pmatrix}_L \quad \begin{pmatrix} c \\ s' \end{pmatrix}_L \quad \begin{pmatrix} t \\ b' \end{pmatrix}_L \quad \begin{matrix} u_R & c_R & t_R \\ d_R & s_R & b_R \end{matrix} \quad \begin{matrix} +2/3 \\ -1/3 \end{matrix}$$

+ Leptons

## Fundamental Forces

Gauge Theory

$$: \underbrace{SU(3)}_{\text{QCD}} \otimes SU(2)_L \otimes U(1)_Y$$

Strong Interactions (Gluons)      Electroweak Interactions ( $W^\pm, Z^0, \gamma$ )

Neutral Higgs

→ Charged Current Interactions only between left-handed Quarks

$$\frac{g_2}{2\sqrt{2}} \gamma_\mu (1 - \gamma_5) \cdot V_{td}$$

# Operator product expansion in the SM

$$H_{\text{eff}} = \frac{G_F}{\sqrt{2}} V_{\text{CKM}} \sum_i \underbrace{C_i(\mu)}_{\text{Coupling Constants}} \underbrace{Q_i}_{\text{Four Quark Interaction Vertex}}$$

$\{ \text{Wilson Coefficients} \}$   $\{ \text{Local Operators} \}$

$Q_i \leftrightarrow$  **Four Quark Interaction Vertex**  $(\bar{s}d)_{V-A} (\bar{s}d)_{V-A}$

$C_i(\mu) \leftrightarrow$  **Coupling Constants**  $C(\mu) = \left[ \frac{\alpha_s(M_W)}{\alpha_s(\mu)} \right]^{\frac{6}{23}}$

$$A(M \rightarrow F) = \frac{G_F}{\sqrt{2}} V_{\text{CKM}} \sum_i C_i(\mu) \langle F | Q_i(\mu) | M \rangle$$

$\{K, B, D, \dots\}$

$\left\{ \begin{array}{l} \pi\pi, \pi\nu\bar{\nu} \\ \mu\bar{\mu}, K^*\gamma, \dots \end{array} \right\}$

$M_W$   $\mu=0(1 \text{ GeV}, m_b)$   $0$

**Short** **RG** **Long Distance**

$\left\{ \begin{array}{l} \text{Top SUSY} \\ H^\pm \dots \end{array} \right\}$ 
 $\left\{ \begin{array}{l} \text{Renormalization Group} \\ \sum \left( \alpha_s \log \frac{M_W}{\mu} \right)^n \end{array} \right\}$ 
 $\left\{ \begin{array}{l} \text{Lattice, } 1/N \\ \text{HQET, QCDs} \\ \text{ChPT} \end{array} \right\}$

$b \rightarrow s_L$  (SM)

$b \rightarrow s_L$  (NP)

- QCD Penguin operators

$$Q_{3,5} = (\bar{s}b)_{V-A} (\bar{q}q)_{V\mp A} \rightarrow \tilde{Q}_{3,5} = (\bar{s}b)_{V+A} (\bar{q}q)_{V\pm A}$$

$$Q_{4,6} = (\bar{s}_i b_j)_{V-A} (\bar{q}_j q_i)_{V\mp A} \rightarrow \tilde{Q}_{4,6} = (\bar{s}_i b_j)_{V+A} (\bar{q}_j q_i)_{V\pm A}$$

- Chromo/Electromagnetic Dipole Operators

$$Q_{7\gamma} = \frac{e}{8\pi^2} m_b \bar{s}_i \sigma^{\mu\nu} (1 + \gamma_5) b_i F_{\mu\nu} \rightarrow \tilde{Q}_{7\gamma} = \frac{e}{8\pi^2} m_b \bar{s}_i \sigma^{\mu\nu} (1 - \gamma_5) b_i F_{\mu\nu}$$

$$Q_{8g} = \frac{g_s}{8\pi^2} m_b \bar{s} \sigma^{\mu\nu} (1 + \gamma_5) t^a b G_{\mu\nu}^a \rightarrow \tilde{Q}_{8g} = \frac{g_s}{8\pi^2} m_b \bar{s} \sigma^{\mu\nu} (1 - \gamma_5) t^a b G_{\mu\nu}^a$$

- Electroweak Penguin Operators

$$Q_{7,9} = \frac{3}{2} (\bar{s}b)_{V-A} e_q (\bar{q}q)_{V\pm A} \rightarrow \tilde{Q}_{7,9} = \frac{3}{2} (\bar{s}b)_{V+A} e_q (\bar{q}q)_{V\mp A}$$

$$Q_{8,10} = \frac{3}{2} (\bar{s}_i b_j)_{V-A} e_q (\bar{q}_j q_i)_{V\pm A} \rightarrow \tilde{Q}_{8,10} = \frac{3}{2} (\bar{s}_i b_j)_{V+A} e_q (\bar{q}_j q_i)_{V\mp A}$$

**Right-handed current is a signature of new physics**

# Where can we search for RH currents?

**Flavor changing neutral current transitions (FCNC):** *change the flavor of a fermion current without altering it's electric charge*

FCNC in SM only possible via loops.

New physics contribution can be comparable and even dominating to (small) SM amplitudes.

New physics appears not only in modifications of branching fractions, but also in asymmetries (e.g.,  $CP$ ) and in angular effects.

$\Rightarrow$  Sensitive also to spin structure of new physics

# How do you measure RH currents?

The most powerful method is with time-dependent  $CP$  violation measurements in  $B \rightarrow K^*(K_S^0 \pi^0) \gamma$  decays.

# Time-dependent $CP$ asymmetry in $B \rightarrow K^*(K_S^0\pi^0)\gamma$

$$\mathcal{A}(\Delta t) = S \sin(\Delta m \Delta t) + A \cos(\Delta m \Delta t)$$

Possible due to interference with mixing between dominant decay helicities

$$b \rightarrow s\gamma_L \quad \text{or} \quad \bar{b} \rightarrow \bar{s}\gamma_R$$

and suppressed decay helicities:

$$b \rightarrow s\gamma_R \quad \text{or} \quad \bar{b} \rightarrow \bar{s}\gamma_L$$

In **SM** one naively expects:

$$S_{K_S^0\pi^0\gamma} = -2\frac{m_s}{m_b} \sin 2\phi_1 \sim -0.03$$

**Sensitive to helicity-changing NP contributions.**

Example: Left-Right symmetric model

$$\rightarrow S_{K_S^0\pi^0\gamma} \sim 0.67 \cos 2\phi_1 \sim 0.5$$

# $B \rightarrow K^* \gamma$ at $B$ -factories

$$S = -0.16 \pm 0.22 \quad C = -0.04 \pm 0.14$$

Measurements statistically limited

# $B \rightarrow K^* \gamma$ at $B$ -factories

$$S = -0.16 \pm 0.22 \quad C = -0.04 \pm 0.14$$

Measurements statistically limited

$$\sigma(S_{K^* \gamma}) \approx 0.09 \quad @ \quad 5 \text{ ab}^{-1}$$

# $B \rightarrow K^* \gamma$ at $B$ -factories

$$S = -0.16 \pm 0.22 \quad C = -0.04 \pm 0.14$$

Measurements statistically limited

$$\begin{aligned} \sigma(S_{K^* \gamma}) &\approx 0.09 \quad @ \quad 5 \text{ ab}^{-1} \\ &\approx 0.03 \quad @ \quad 50 \text{ ab}^{-1} \end{aligned}$$

# $B \rightarrow K^* \gamma$ at $B$ -factories

$$S = -0.16 \pm 0.22 \quad C = -0.04 \pm 0.14$$

Measurements statistically limited

$$\begin{aligned} \sigma(S_{K^* \gamma}) &\approx 0.09 \quad @ \quad 5 \text{ ab}^{-1} \\ &\approx 0.03 \quad @ \quad 50 \text{ ab}^{-1} \end{aligned}$$

# RH currents also modify CKM angle $\phi_3(\gamma)$

## Additional $CP$ phases from right-handed charged current interactions

$$A(B^+ \rightarrow \bar{D}^0 K^+) = A_B,$$

$$A(B^+ \rightarrow D^0 K^+) = A_B r_+ e^{i(\phi_{DK} + \delta_{DK})}$$

$$A(B^- \rightarrow D^0 K^-) = A_B,$$

$$A(B^- \rightarrow \bar{D}^0 K^-) = A_B r_- e^{i(-\phi_{DK} + \delta_{DK})}$$

SM null test:  $r_+ = r_-$  in SM

$$A_{CP}(B^+ \rightarrow D^0 K^+) = \frac{\Gamma(B^+ \rightarrow D^0 K^+) - \Gamma(B^- \rightarrow \bar{D}^0 K^-)}{\Gamma(B^+ \rightarrow D^0 K^+) + \Gamma(B^- \rightarrow \bar{D}^0 K^-)} = \frac{r_+^2 - r_-^2}{r_+^2 + r_-^2},$$

## RH currents also modify CKM angle $\phi_3(\gamma)$

$$A(B^+ \rightarrow D^0 K^+) = |A_L| e^{i(\phi_3^L + \delta_L)} + |A_R| e^{i(\phi_3^R + \delta_R)}$$

$$A(B^- \rightarrow \bar{D}^0 K^-) = |A_L| e^{i(-\phi_3^L + \delta_L)} + |A_R| e^{i(-\phi_3^R + \delta_R)}$$

$$\phi_3^{L(R)} = \arg(V_{ub}^{L(R)*})$$

$$\begin{aligned} R_{DK} &= e^{2i\phi_3^L} \frac{A(B^- \rightarrow \bar{D}^0 K^-)}{A(B^+ \rightarrow D^0 K^+)} \\ &= \frac{1 + |A_R/A_L| e^{i(-\phi_3^R + \phi_3^L + \delta)}}{1 + |A_R/A_L| e^{i(\phi_3^R - \phi_3^L + \delta)}} \end{aligned}$$

$$A_{CP}(B^+ \rightarrow D^0 K^+) = \frac{1 - |R_{DK}|^2}{1 + |R_{DK}|^2}$$

$$\phi_{DK} = \phi_3^L - \arg(R_{DK})/2.$$

# Summary

- Belle II expects to improve precision to  $\alpha \approx 0.3^\circ$ ,  $\beta \approx 1.0^\circ$ ,  $\gamma \approx 1.5^\circ$ .
- Improvement in precision should help to resolve the tension in  $\mathcal{R}(D^{(*)})$ ,  $\mathcal{R}(K)$ , inclusive and exclusive measurements of  $|V_{ub}|$  and  $|V_{cb}|$ , and more.

Future sensitivities *assuming data consistent with the SM* ([arXiv:1309.2293](https://arxiv.org/abs/1309.2293))
