

Theoretische Physik D - Quantenmechanik I

Übungsblatt 8 - Lösung

SS 2005

Dieses Dokument ist ein Mitschrieb aus den Tutorien. Es besitzt daher keinen Anspruch auf Vollständigkeit oder Richtigkeit und darf somit nicht als Referenzquelle genutzt werden.

Aufgabe 1

(i) (kräftefreier Fall)

$$\hat{H} = \frac{p^2}{2m} = -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2}, \quad \hat{p}|k\rangle = p|k\rangle, \quad \langle x|k\rangle = \frac{1}{\sqrt{2\pi}} e^{ikx}$$

Hängt der Hamilton Operator nicht explizit von der Zeit ab, erhält man

$$|\psi(t)\rangle = e^{-i\frac{\hat{H}}{\hbar}t} |\psi(0)\rangle$$

Entwicklung nach Energie-Eigenzuständen:

$$|\psi(0)\rangle = \left(\int dk |k\rangle \langle k| \right) |\psi\rangle = \int dk |k\rangle \underbrace{\langle k|\psi(0)\rangle}_{g(k)} = \int dk g(k) |k\rangle$$

Dabei ist $g(k)$ der Entwicklungskoeffizient und $|k\rangle$ Eigenzustand des Hamiltonoperators.

$$\begin{aligned} g(k) &= \langle k|\psi(0)\rangle = \int dx \langle k|x\rangle \langle x|\psi(0)\rangle = \int dx \frac{1}{\sqrt{2\pi}} e^{-ikx} \psi(x, 0) \\ &= \dots = \left(\frac{1}{\beta\sqrt{\pi}} \right)^{\frac{1}{2}} e^{-\frac{(k-k_0)^2}{2\beta^2}} e^{-i(k-k_0)a} \end{aligned}$$

$$\text{mit } k_0 = \frac{p_0}{\hbar}, \quad v_0 = \frac{\hbar k}{m}, \quad \omega_0 = \frac{\hbar k_0^2}{2m}$$

$$\begin{aligned} |\psi(t)\rangle &= e^{-i\frac{\hat{H}}{\hbar}t} |\psi(0)\rangle = e^{-i\frac{\hat{H}}{\hbar}t} \int dk g(k) |k\rangle \\ &= \int dk g(k) e^{-i\frac{\hat{H}}{\hbar}t} |k\rangle = \int dk g(k) e^{-\frac{i}{\hbar}t \frac{p^2}{2m}} |k\rangle \\ &= \int dk g(k) e^{-\frac{i}{\hbar}t \frac{\hbar^2 k^2}{2m}} |k\rangle = \int dk g(k) e^{-i\omega t} |k\rangle \end{aligned}$$

$$\text{mit } E = \frac{\hbar^2 k^2}{2m}, \quad \omega = \frac{E}{\hbar}$$

$$\begin{aligned} \psi(x, t) &= \langle x|\psi(t)\rangle = \int dk g(k) e^{-ik\omega} \underbrace{\langle x|k\rangle}_{=e^{ikx}/\sqrt{2\pi}} \\ &= \dots = \left(\frac{\beta}{\sqrt{\pi}} \right)^{\frac{1}{2}} \frac{1}{\sqrt{1 + \frac{i\hbar t\beta^2}{m}}} e^{i(k_0 x - \omega_0 t)} e^{-\frac{\beta^2(x-a-v_0 t)^2}{2(1+\frac{i\hbar t\beta^2}{m})}} \end{aligned}$$

$$|\psi(x,t)|^2 = \frac{\beta}{\sqrt{\pi}} \frac{1}{\sqrt{1 + \frac{\hbar^2 t^2 \beta^4}{m^2}}} e^{-\frac{\beta^2(x-a-v_0 t)^2}{(1+\frac{\hbar^2 t^2 \beta^4}{m^2})}}$$

$$\Rightarrow \langle x \rangle = a + v_0 t \text{ und } \Delta x = \frac{1}{\sqrt{2}\beta} \sqrt{1 + \frac{\hbar^2 t^2 \beta^4}{m^2}}$$

(ii) (Oszillatoren-Potential)

$$V(x) = \frac{1}{2} m \omega^2 x^2, \quad \hat{H} = \frac{p^2}{2m} + \frac{1}{2} m \omega^2 x^2, \quad H|\phi_n\rangle = E_n |\phi_n\rangle, \quad E_n = \hbar \omega (n + \frac{1}{2})$$

Hängt der Hamilton Operator nicht explizit von der Zeit ab, erhält man

$$|\psi(t)\rangle = e^{-i \frac{\hat{H}}{\hbar} t} |\psi(0)\rangle$$

Entwicklung nach Energie-Eigenfunktionen:

$$|\psi(0)\rangle = (\sum_n |\phi_n\rangle \langle \phi_n|) |\psi(0)\rangle = \sum_n \langle \phi_n | \psi(0) \rangle |\phi_n\rangle = \sum_n c_n |\phi_n\rangle$$

$$\begin{aligned} c_n &= \langle \phi_n | \psi(0) \rangle \\ &= \langle \phi_n | \left(\int dx' |x'\rangle \langle x'| \right) |\psi(0)\rangle \\ &= \int dx' \phi_n(x') \psi(x', 0) \end{aligned}$$

$$\text{mit } \phi_n(x) = \langle \phi_n | x \rangle = \left(\frac{\beta^2}{\pi}\right)^{\frac{1}{4}} \frac{1}{\sqrt{2^n n!}} e^{-\frac{\beta^2 x^2}{2}} H_n(\beta x) \quad \text{und} \quad \beta = \sqrt{\frac{m\omega}{\hbar}}$$

$$\begin{aligned} \Rightarrow c_n &= \int dx' \phi_n(x') \psi(x', 0) \\ &= \left(\frac{\beta^2}{\pi}\right)^{\frac{1}{2}} \frac{1}{\sqrt{2^n n!}} \int dx' e^{-\frac{\beta^2 x'^2}{2}} H_n(\beta x') e^{-\frac{\beta^2(x'-a)^2}{2}} \\ &\stackrel{y'=\beta x'}{=} \frac{1}{\sqrt{\pi}} \frac{1}{\sqrt{2^n n!}} \int dy' H_n(y') e^{-(y'-\frac{\beta a}{2})^2} e^{-\frac{\beta^2 a^2}{4}} \\ &\stackrel{\text{Hinweis}}{=} \frac{1}{\sqrt{2^n n!}} e^{-\frac{\beta^2 a^2}{4}} (\beta a)^n \end{aligned}$$

$$\begin{aligned} \psi(x, t) &= \langle x | \psi(t) \rangle \\ &= \langle x | e^{-i \frac{\hat{H}}{\hbar} t} |\psi(0)\rangle \\ &= \langle x | e^{-i \frac{\hat{H}}{\hbar} t} \sum_n c_n |\phi_n\rangle \\ &= \sum_n c_n \langle x | e^{-i \frac{\hbar \omega (n + \frac{1}{2})}{\hbar} t} |\phi_n\rangle \\ &= \sum_n c_n e^{-i \omega (n + \frac{1}{2}) t} \langle x | \phi_n \rangle \\ &= \left(\frac{\beta^2}{\pi}\right)^{\frac{1}{4}} e^{-\frac{\beta^2}{4}(2x^2+a)} e^{-\frac{i\omega t}{2}} \sum_n \frac{(\beta a)^n}{2^n n!} H_n(\beta x) e^{-i\omega nt} \\ &\stackrel{\text{Hinweis}}{=} \left(\frac{\beta^2}{\pi}\right)^{\frac{1}{4}} e^{-\frac{\beta^2}{4}(2x^2+a)} e^{-\frac{i\omega t}{2}} \exp \left[-\frac{\beta^2 a^2}{4} e^{-2i\omega t} + \beta^2 a x e^{-i\omega t} \right] \\ &= \dots = \left(\frac{\beta^2}{\pi}\right)^{\frac{1}{4}} e^{-\frac{\beta^2}{a}(x-a \cos(\omega t))^2} e^{-i(\frac{\omega t}{2} - \frac{\beta^2 a^2}{4} \sin(2\omega t) + \beta^2 a x \sin(\omega t))} \end{aligned}$$

(verwende: $\cos(2\omega t) = 2\cos^2(\omega t) - 1$)

$$|\psi(x, t)|^2 = \frac{\beta}{\sqrt{\pi}} e^{-\beta^2(x - a \cos(\omega t))^2}$$

$$\Rightarrow \Delta x = \frac{1}{\sqrt{2}\beta}, \quad \langle x \rangle = a \cos(\omega t)$$

Aufgabe 2

Paulimatrizen:

$$\sigma_1 = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \sigma_2 = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, \quad \sigma_3 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

(i) $i = 1, j = 2$

$$\{\sigma_1, \sigma_2\} = \sigma_1\sigma_2 + \sigma_2\sigma_1 = \begin{pmatrix} i & 0 \\ 0 & -i \end{pmatrix} + \begin{pmatrix} -i & 0 \\ 0 & i \end{pmatrix} = 0 = 2\delta_{12}I \quad \checkmark$$

$$[\sigma_1, \sigma_2] = \sigma_1\sigma_2 - \sigma_2\sigma_1 = 2i \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} = 2i\epsilon_{123}\sigma_3 \quad \checkmark$$

(ii)

$$\begin{aligned} (\vec{a} \cdot \vec{a})(\vec{a} \cdot \vec{b}) &= (\sigma_1 a_1 + \sigma_2 a_2 + \sigma_3 a_3)(\sigma_1 b_1 + \sigma_2 b_2 + \sigma_3 b_3) \\ &= \sum_{i,j=1}^3 \sigma_i a_i \sigma_j b_j \\ &= \sum_{i,j=1}^3 a_i b_j (\sigma_i \sigma_j) \\ &= \sum_{i,j=1}^3 a_i b_j \frac{1}{2} (2\delta_{ij}I + 2i\epsilon_{ijk}\sigma_k) \\ &= \sum_{i,j=1}^3 a_i b_j \delta_{ij}I + \sum_{k=1}^3 (i\sigma_k (\sum_{ij=1}^3 \epsilon_{ijk} a_i b_j)) \\ &= \vec{a} \cdot \vec{b} I + i\vec{\sigma}(\vec{a} \times \vec{b}) \quad \checkmark \end{aligned}$$

(iii)

$$M = a_0 I + a_1 \sigma_1 + a_2 \sigma_2 + a_3 \sigma_3$$

$$\text{Sp}(\sigma_1) = \text{Sp}(\sigma_2) = \text{Sp}(\sigma_3 = 0) \Rightarrow \text{Sp}(M) = 2a_0 \Rightarrow a_0 = \frac{\text{Sp}(M)}{2}$$

$$\begin{aligned} \sigma_1 \cdot M &= a_0 \sigma_1 + a_1 I + a_2 \sigma_1 \sigma_2 + a_3 \sigma_1 \sigma_3 \\ &= a_0 \sigma_1 + a_1 I + ia_2 \sigma_3 - ia_3 \sigma_2 \end{aligned}$$

$$\Rightarrow \text{Sp}(\sigma_i \cdot M) = 2a_i \Rightarrow a_i = \frac{\text{Sp}(\sigma_i M)}{2}$$

Aufgabe 3

(i) Der Zeitentwicklungsoperator ist gegeben durch:

$$U(t, t_0) = e^{-i \frac{\hat{H}}{\hbar} (t - t_0)}$$

Dabei ist die Energie einer Magnetisierung gegeben durch:

$$\begin{aligned} H &= -\vec{M} \cdot \vec{B} \\ \Rightarrow U(t, 0) &= e^{-i \frac{-\vec{M} \cdot \vec{B}}{\hbar} t} \\ \text{mit } \vec{M} \cdot \vec{B} &= \gamma \begin{pmatrix} S_x \\ S_y \\ S_z \end{pmatrix} \cdot \begin{pmatrix} \omega_x/\gamma \\ \omega_y/\gamma \\ \omega_z/\gamma \end{pmatrix} = -\omega_x S_x - \omega_y S_y - \omega_z S_z \\ \Rightarrow M &= \frac{1}{\hbar} (-\vec{M} \cdot \vec{B}) = \frac{1}{\hbar} (\omega_x S_x + \omega_y S_y + \omega_z S_z) \quad \checkmark \end{aligned}$$

aus $S_i = \frac{\hbar}{2} \sigma_i$ folgt die Matrixdarstellung von M :

$$\begin{aligned} M &= \frac{1}{2} \left[\omega_x \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} + \omega_y \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} + \omega_z \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \right] \\ &= \frac{1}{2} \begin{pmatrix} \omega_z & \omega_x - i\omega_y \\ \omega_x + i\omega_y & -\omega_z \end{pmatrix} \end{aligned}$$

weiterhin:

$$\begin{aligned} M^2 &= \frac{1}{4} \begin{pmatrix} \omega_z & \omega_x - i\omega_y \\ \omega_x + i\omega_y & -\omega_z \end{pmatrix} \begin{pmatrix} \omega_z & \omega_x - i\omega_y \\ \omega_x + i\omega_y & -\omega_z \end{pmatrix} \\ &= \frac{1}{4} \begin{pmatrix} \omega_z & \omega_x - i\omega_y \\ \omega_x + i\omega_y & -\omega_z \end{pmatrix} \\ &= \frac{1}{4} \begin{pmatrix} \omega_0^2 & 0 \\ 0 & \omega_0^2 \end{pmatrix} \\ &= \frac{\omega_0^2}{4} I \end{aligned}$$

mit $\omega_0^2 = \omega_x^2 + \omega_y^2 + \omega_z^2$

vergleiche: $-\gamma |\vec{B}_0| = -\gamma \left| \begin{pmatrix} -\omega_x/\gamma \\ -\omega_y/\gamma \\ -\omega_z/\gamma \end{pmatrix} \right| = -\sqrt{\omega_x^2 + \omega_y^2 + \omega_z^2}$

$$\Rightarrow \omega_0 = -\gamma |\vec{B}_0|$$

$$\begin{aligned}
U(t, 0) &= e^{-iMt} \\
&= \sum_{n=0}^{\infty} \frac{1}{n!} (-iMt)^n \\
&= \sum_{n=0}^{\infty} \frac{1}{(2n)!} (-iMt)^{2n} + \sum_{n=0}^{\infty} \frac{1}{(2n+1)!} (-iMt)^{2n+1} \\
&= \sum_{n=0}^{\infty} \frac{((-i)^2)^n}{(2n)!} (M^2)^n t^{2n} + \sum_{n=0}^{\infty} \frac{((-i)^2)^n \cdot (-i)}{(2n+1)!} (M^2)^n \cdot M t^{2n+1} \\
&= \left(\sum_{n=0}^{\infty} \frac{(-1)^n}{(2n)!} \left(\frac{\omega_0}{2} \right)^{2n} t^{2n} \right) \cdot I + \left(\sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)!} \left(\frac{\omega_0}{2} \right)^{2n+1} t^{2n+1} \right) \cdot M \left(-i \frac{2}{\omega_0} \right) \\
&= \cos \left(\frac{\omega_0 t}{2} \right) I - \frac{2i}{\omega_0} \sin \left(\frac{\omega_0 t}{2} \right) M
\end{aligned}$$

(ii) kohärente Oszillation

gegeben: $|\Psi(0)\rangle = |+\rangle$

$$\begin{aligned}
P_{++}(t) &= |\langle +|\Psi(t)\rangle|^2 \\
&= |\langle +|U(t, 0)|\Psi(0)\rangle|^2 \\
&= |\langle +|U(t, 0)|+\rangle|^2 \quad \checkmark \\
&= \left| \langle +| \cos \left(\frac{\omega_0 t}{2} \right) I - \frac{2i}{\omega_0} M \sin \left(\frac{\omega_0 t}{2} \right) |+\rangle \right|^2 \\
&= \left| \langle +| \begin{pmatrix} \cos \left(\frac{\omega_0 t}{2} \right) \\ 0 \end{pmatrix} - \frac{i}{\omega_0} \begin{pmatrix} \omega_z \\ \omega_x + i\omega_y \end{pmatrix} \sin \left(\frac{\omega_0 t}{2} \right) \right|^2 \\
&= \left| \cos \left(\frac{\omega_0 t}{2} \right) - \frac{i\omega_z}{\omega_0} \sin \left(\frac{\omega_0 t}{2} \right) \right|^2 \\
&= \cos^2 \left(\frac{\omega_0 t}{2} \right) + \frac{\omega_z^2}{\omega_0^2} \sin^2 \left(\frac{\omega_0 t}{2} \right) \\
&= 1 - \sin^2 \left(\frac{\omega_0 t}{2} \right) \cdot \frac{\omega_0^2}{\omega_0^2} + \frac{\omega_0^2 - \omega_x^2 - \omega_y^2}{\omega_0^2} \sin^2 \left(\frac{\omega_0 t}{2} \right) \\
&= 1 - \frac{\omega_x^2 + \omega_y^2}{\omega_0^2} \sin^2 \left(\frac{\omega_0 t}{2} \right) \quad \checkmark
\end{aligned}$$
